

1. What is the Internet of Things (IoT)?

- IoT is a Object that is connected to the Internet.

What is IoT, and how does it work?

- I think IoT is devices connected to the internet that share data.

What are the main components of an IoT system?

- It has devices, internet, cloud, and an app.

Why is IoT important today?

- I think it makes life easier and saves time.

2. IoT vs. Internet vs. Embedded Systems

What is the difference?

The Internet connects people embedded systems run devices and IoT connects those devices online.

Can an embedded system exist without the Internet? Can IoT exist without embedded systems?

Yes, embedded systems can. No, IoT cannot.

ex.

- Internet: Gmail.
- Embedded: Washing machine.
- IoT: Smart CCTV.

3. Real-World IoT Applications

What industries use IoT, and what problems does it solve?

-Hospitals, farms, and factories use IoT. It makes work easier and simpler.

Choose one IoT application and explain it.

-Smart Watches It tracks heart rate and steps and sleep.

What are the benefits and challenges of IoT?

- It saves time but needs good internet.
